

# SOFR & Initial Margin

Junbeom Lee

Yuanta Securities Korea

# What is *Variation Margin*?

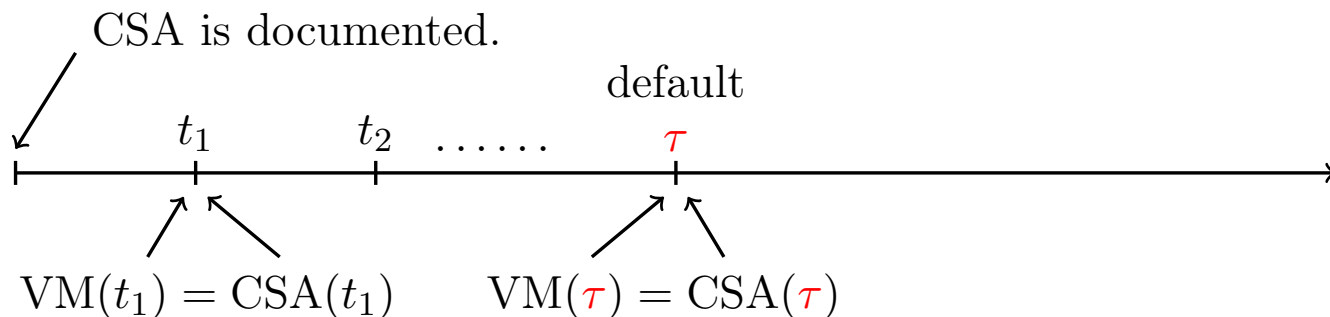

- CSA amount and VM are in CSA (credit support annex).
- Under Basel's recommendation,  $VM(t) = CSA(t)$ .

BCBS & IOSCO. (2015). “For variation margin, the full amount necessary to **fully collateralise the mark-to-market exposure** . . . .”

# What is *Variation Margin*?

# What is *Initial Margin*?

- For the *gap risk*, IM is given by

$$\rho_t[(\text{CSA}(t + \Delta) - \text{CSA}(t))^{\pm}], \quad (1)$$

where  $\rho$  is VaR or Expected Shortfall.

# What is *Initial Margin*?

- For the *gap risk*, IM is given by

$$\rho_t[(\text{CSA}(t + \Delta) - \text{CSA}(t))^{\pm}], \quad (1)$$

where  $\rho$  is VaR or Expected Shortfall.

- ISDA introduced **SIMM**(standard initial margin model).

# What is *Initial Margin*?

- For the *gap risk*, IM is given by

$$\rho_t[(\text{CSA}(t + \Delta) - \text{CSA}(t))^{\pm}], \quad (1)$$

where  $\rho$  is VaR or Expected Shortfall.

- ISDA introduced **SIMM**(standard initial margin model).
- NH started the SIMM project. KAP passed the SIMM test by KRX.

# What is *Initial Margin*?

$$\rho_t[(\text{CSA}(t + \Delta) - \text{CSA}(t))^{\pm}], \quad (1)$$

where  $\rho$  is VaR or Expected Shortfall.

- ISDA introduced **SIMM**(standard initial margin model).
- NH started the SIMM project. KAP passed the SIMM test by KRX.
- Valuation considering the cost/benefit of **VM/IM** is called **FVA/MVA** (respectively). Together with CVA/DVA, the comprehensive adjustment is called XVA.

# What are the differences?

- VM is *rehypothecated*, but IM is *segregated*.

# What are the differences?

- VM is *rehypothecated*, but IM is *segregated*.
- Cash VM is remunerated by Fed Funds rate, Eonia, etc. Then, how much pay for IM? I don't know.

# What are the differences?

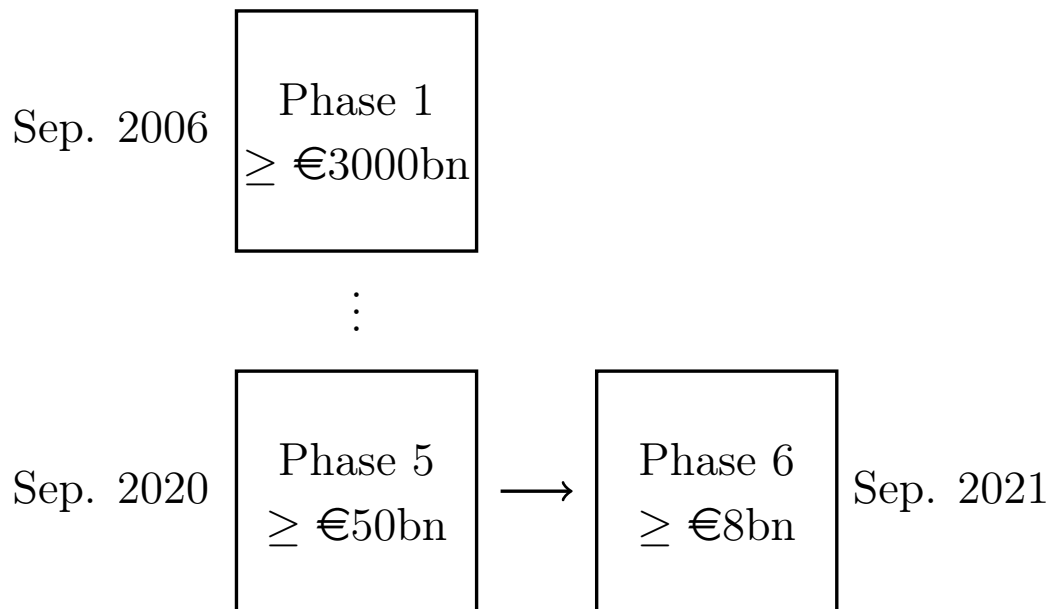

- VM is *rehypothecated*, but IM is *segregated*.
- Cash VM is remunerated by Fed Funds rate, Eonia, etc. Then, how much pay for IM? I don't know.
- IM is **NOT** netted. I give her  $\rho_t[(\text{CSA}(t + \Delta) - \text{CSA}(t))^+]$ , and she gives me  $\rho_t[(\text{CSA}(t + \Delta) - \text{CSA}(t))^-]$ .

# What are the differences?

- IM is **NOT** netted. I give her  $\rho_t[(\text{CSA}(t + \Delta) - \text{CSA}(t))^+]$ , and she gives me  $\rho_t[(\text{CSA}(t + \Delta) - \text{CSA}(t))^-]$ .
- Good news! IM threshold is €50 millions (VM threshold is zero).

# What is the timeline? AANA knows the answer.

The timeline depends on AANA (aggregate average notional amount).

Thank You!
